

# Application Note – 4-20mA Follower Option on Drives w/ Other Options

Requirement: 4-20mA signal follower input on a drive that already has another option card

Solution: The -5 (4-20mA option card) can be mounted in such a way to not conflict with the other option card

Valid for Models: 130/132 Series; 530BC/BRC Series

Shown for 130/132 Series, the same concept applies to the 530 Series: The -5 option board has installation holes on each end, labelled for the Series of control it is being used with (the 130 Series uses a 125 Series main board). Use the 'wrong' set of holes to install the option card so that it extends from the body of the main control. Order the -5 option as a field installed kit, so that the necessary mounting hardware is included. Note in this example we are using the 250/500 Series holes on a 125 Series control.
